## 'Angry Birds' iPhone Game To Get Line Of Toys, Possibly Movie

**TC** Shared by **TechCrunch**

[techcrunch.com](#) - According to Variety, Rovio, the company that makes 'Angry Birds' has been shopping the beloved iPhone game around Hollywood, and currently rolling out some franchising deals.

"Rovio, the Finnish creator of the hit iPhone and iPad game, which has sold more than 6.5 million downloads, wants to turn the property into a major franchise that crosses over to other platforms — from TV shows and movies to toys and comicbooks."

While we can't say anything definite about the TV shows and movies part, TechCrunch has confirmed that the company will in fact be making 'Angry Birds' toys (Rovio representative Ville Heijari would not give us further info).

Rumor has it that the toys will be in the form of stuffed Angry Birds, and the game, which follows a flock of birds fighting evil pigs, may be the first major intellectual property to go straight from iPhone to plush form.

## YC-Funded MessageParty Ties Location With Chat Rooms

**TC** Shared by **TechCrunch**

[techcrunch.com](#) - With the rise of GPS-enabled smartphones, developers are eager to integrate location-based functionality into whatever they can. So it's no surprise when MessageParty, a Y Combinator company that's launching this week, says that it's looking to tie location with chat rooms to let you communicate with the people around you in real-time. You can

## HTML5 Support

### What is HTML5?

HTML5 describes a number of mechanical techniques beginning to gain support from the major browser manufacturers.

These techniques include 'drawing' programmatically, establishing your geographic location using your devices GPS, techniques which allow web-applications behave more like installed software and native Video & Audio controls which do not require a third-party plug-in like Adobe Flash.

This site uses [Modernizr](#), a javascript library which detects your browsers' support for the [a selection of the latest CSS3 & HTML5 features](#). It helps web designers to implement progressive enrichment techniques.

## HTML5 "Forms 2.0" Tests

### What're HTML5 Forms?

The first Web Forms 2.0 Draft appeared as far back as February 2004. Now superseded by the [Forms chapter](#) of the HTML5 specification it introduces new elements which offer a wide range of functionality previously only possible with the help of third party scripts.

Your browser's support for basic Web Forms 2.0 is show in the list to the right.

## README.md

# Pindah

A tool for writing Android applications in [Mirah](#).

## Requirements

You must have the [Android SDK](#) installed with the `tools/` directory placed on your \$PATH. Inside `tools/`, the `android` program will allow you to download "platform" packages corresponding with Android versions you wish to develop against. You'll need to install "Android SDK Platform tools" and at least one platform revision to get started. At the time of this writing, Android 2.1 (revision 7) [covers over 94% of the market](#) and is a reasonable target for new applications. Once the platform tools are installed, place the SDK's `platform-tools/` directory on your \$PATH as well.

You'll also need [JRuby](#) version 1.6 or higher installed with bin/ on your \$PATH. If your gem and rake are not from from JRuby, prefix the gem and rake commands with `jruby -S`:

```
$ gem install pindah
```

# Pindah

## Usage

The `pindah` executable will create a new project starting point given a package name. A package is a namespace for your code that is often derived from a domain name you own, but can be any hierarchical identifier as long as it's unique.

```
$ pindah create org.example.hello_world # optional path and activity name arguments  
$ cd hello_world && tree
```
